

Zion Energy Services: Dispatch and Workforce Operations Platform

Techno-Commercial Proposal

**(Version 4.0)
9th Feb 2026**

Submitted and Presented By:-

Aaditya Kapoor
Head of Global Business – Sales

Nile Technologies Pvt. Ltd.
A-51, Sector 57, Noida, UP 201301

1. Project Brief and Summary

Introduction and Purpose	Zion Energy Services operates in a highly dynamic, field-driven environment where teams, equipment, and job sites are constantly moving. Operational efficiency, workforce accountability, safety compliance, and cost control — particularly around overtime — are critical to scale without friction.
---------------------------------	---

The proposed platform is a **centralized Dispatch & Workforce Operations System** designed to give Zion a **real-time operational command view** of its field workforce, while empowering employees with a simple mobile interface to execute jobs accurately and compliantly.

At its core, the system unifies:

- Workforce management
- Job dispatch & execution
- Location and attendance intelligence
- Overtime and cost control
- Compliance monitoring

into a **single operational layer**, replacing fragmented tools, manual tracking, and reactive decision-making.

The platform will be delivered as:

- A **Web-based Admin Dashboard** for operations, dispatch, payroll, and management teams
- A **Mobile Application for Field Employees** to handle check-ins, job execution, and location-based actions

The system is designed to be **integration-ready**, allowing future connectivity with payroll, accounting, ERP, or other operational systems used by Zion.

2. Platform Modules

Workforce & Team Management

A structured view of all employees and teams, their roles, assignments, current status, and compliance posture. This module forms the foundation for dispatching, scheduling, and accountability.

Dispatch & Job Operations

Centralised creation, assignment, and monitoring of jobs across multiple sites and teams. Dispatchers can assign teams, track execution in real time, and monitor deviations or delays.

Attendance & Time Intelligence

Location-aware attendance tracking that captures when and where employees start and finish work. This removes ambiguity around hours worked and creates a reliable base for payroll and compliance.

Location & Geo-Compliance

Live location monitoring linked to job sites and defined geo-fences. The system detects when employees check in from unauthorised locations, leave job sites unexpectedly, or deviate from assigned routes.

Overtime Monitoring & Cost Control

Real-time and predictive monitoring of overtime exposure at employee, team, and organisational levels — including visibility into cost impact before overtime thresholds are breached.

Alerts, Exceptions & Intelligence

Automated detection of anomalies such as late arrivals, early exits, unauthorised stops, geo-fence violations, or overtime risks. The platform highlights issues proactively instead of relying on post-fact reports.

Reporting & Analytics

Operational, workforce, and compliance reporting for internal review, audits, payroll validation, and management decision-making.

Automation & Integrations

Rule-based automation for alerts and notifications, and a foundation layer for integration with Zion's existing systems (payroll, accounting, ERP, or HR platforms)

3. Inclusions as Per meeting dated 27th January

- SLA Configuration during Client Setup to confirm client compliances like Waiting Time allowed, Missed Attendance Triggers and more.
- Employee can self-create a Pin and share with Admin for setting up a new Client's Geo-Fence
- Employee to have a section to upload reporting documents for each client case including Map Drawings, Client Information, Task Details etc. These documents can get compiled in the Admin Console under the Client's Case file for Future Reference by Admin or other teams.
- Milage Tracker – To develop a Mileage Tracker for Employee App, allowing App to calculate mileage for each trip and allowing Employee to mark it as a Work/Personal Trip. This Mileage will be submitted to Admin under the Daily Operations of Employees where admin can:
 - Use the Mileage for Tax Rebate Purposes
 - Bill the additional Mileage to Clients
- Crew Lead – Each team created for a task will have a crew lead. Admin may have option to switch out and add a new member to the team under the crew lead without reporting any anomalies.

4. Overall Approach and Workflow

The platform is designed around **how work actually happens on the ground**, not just how it is reported:

1. Planning & Setup

- Employees, teams, roles, job sites, pay rules, and compliance thresholds are configured centrally.
- Geo-fences and business rules are defined upfront.

2. Job Dispatch

- Jobs are created and assigned to teams or individuals.
- Employees receive assignments via the mobile app.

3. Execution in the Field

- Employees check in at job sites using the mobile app.
- Any deviations (location, time, behaviour) are detected in real time.

4. Live Monitoring

- Operations teams monitor workforce activity through the web dashboard.
- Overtime risk, attendance status, and job progress are visible instantly

5. Exception Handling

- Alerts and exceptions are raised automatically.
- Supervisors can intervene early instead of reacting after the fact.

6. Post-Execution & Reporting

- Verified hours feed into timesheets and payroll workflows.
- Reports support compliance, audits, and management review

THE NILE PROMISE

In the scope of work below, Nile has defined it's understanding of the functionalities and workflow desired by the customer to create this proprietary App based software solution. Nile does understand that there may be changes within the ambit of our defined scope during the process of development and minor enhancements WILL NOT lead to any cost escalations and would be done as a part of this fixed cost attributed to this project as a part of this **Techno-Commercial Proposal V4.0**

Nile team is committed to ensuring that the app meets all your business needs and delivers value to you.

***New Functionalities or Modules** (Elements not covered, mentioned or discussed within our defined scope) may fall outside this clause and be taken up as a Change Request upon pre-approvals and mutual consent with the customer.

5. Scope of Work

A. Admin Web Dashboard (Operations and Management)

The Admin Dashboard acts as a single source of truth for Zion's field operations:

Module Name	Functionality
Operational Overview	• Live snapshot of workforce status, active teams, attendance, and hours worked • Overtime exposure and compliance indicators • Interactive map showing employees, job sites, routes, and violations
Employee & Team Management	• Centralized employee directory with role, team, status, and location • Team composition, supervisors, active jobs, and workload distribution • Visibility into individual and team-level compliance issues
Dispatch & Job Control	• Create and assign jobs to teams • Monitor job progress and execution status • View job-specific location and time data
Attendance & Time Tracking	• Daily attendance overview • Check-in and check-out records tied to location • Late arrivals, early exits, absences, and anomalies clearly flagged
Overtime & Cost Monitoring	• Employees approaching or exceeding overtime thresholds • Weekly overtime hours and projected cost impact • Ability to adjust rules and thresholds centrally

Alerts & Exceptions	• Real-time alerts for geo-fence breaches, unauthorised stops, or abnormal patterns • Confidence indicators to help prioritise which alerts need action
Reports & Administration	• Exportable reports for payroll, audits, and management • Role-based access control • System settings, pay rules, geo-fences, and integrations

B. Employee Mobile App (Field Workforce)

The Employee App is intentionally **simple, guided, and compliance-friendly**.

Particulars	Functionality
Core Capabilities	• Secure login • View assigned jobs and schedules • Check-in and check-out at job sites • Automatic location tracking during work hours
Job Execution	• Confirm arrival at job sites • Track time spent per job • Receive alerts or warnings if rules are violated
Transparency for Employees	• Visibility into their own hours worked • Awareness of overtime thresholds • Clear feedback when actions trigger alerts or exceptions

6. Phase-1 Scope Summary

Block 1: Workforce and Organisational Setup

This block establishes the foundation of the system.

At this level, the platform maintains a structured representation of the organisation, including employees, teams, roles, supervisors, and job sites. Each employee is associated with a team, role type, and working rules, such as hourly or salaried classification and overtime thresholds.

This structure allows the system to understand who is working, under what rules, and in which operational context. All downstream functionality such as dispatching, attendance, overtime, and reporting builds on this layer.

The intent here is to centralise workforce data so it is consistent, visible, and usable across the platform rather than fragmented across tools or spreadsheets.

Block 2: Job and Dispatch Operations

This block focuses on how work is planned and assigned.

Jobs are created and scheduled centrally through the Admin Dashboard and assigned to teams or individual employees based on operational needs. Dispatchers and managers can view active jobs, upcoming work, and workforce availability in one place.

Once assigned, jobs flow directly to the employee mobile application, removing the need for manual communication or follow-ups. This ensures that job execution is always tied back to a clear assignment, location, and time window.

The emphasis in this block is clarity and accountability. Every job has an owner, a location, and a time context, which allows accurate tracking downstream

Block 3: Field Execution and Employee Mobile App

This block represents how work happens on the ground.

Field employees interact with the system primarily through a dedicated mobile application. The app allows employees to view assigned jobs, check in at job sites, and check out upon completion. These actions are designed to be quick and intuitive, requiring minimal interaction.

The mobile experience is built to support real field conditions, including remote locations and inconsistent connectivity. Core actions are captured reliably and synchronised when connectivity is available.

This block ensures that execution data such as time worked and location is captured naturally as part of the workday rather than as a separate reporting task.

Block 4: Attendance and Time Intelligence

This block converts field activity into reliable time and attendance data.

Attendance is captured automatically based on employee check-ins, check-outs, and location data. The system maintains a clear record of when employees start and end work, including late arrivals, early departures, and absences.

Attendance data is contextual, meaning it is tied to specific job sites and assignments rather than generic clock-in events. This removes ambiguity and creates a trustworthy foundation for payroll and compliance.

This block replaces manual attendance tracking with a system that reflects actual work conditions.

Block 5: Location Awareness and Geo-Compliance

This block introduces location intelligence into operations.

Job sites can be configured with geo-fences, allowing the system to verify that check-ins and work activity occur at authorised locations. The platform can detect and flag events such as check-ins from outside a job site, unexpected departures, or unusual movement patterns.

Location visibility is available to operations teams through a live map view, enabling real-time awareness of workforce distribution and activity.

The purpose of this block is not surveillance, but operational confidence and compliance, especially in distributed or remote environments.

Block 6: Overtime Monitoring and Cost Visibility

This block addresses one of the most critical operational risks.

The system continuously tracks hours worked against defined overtime thresholds at the employee and team level. As employees approach overtime limits, the platform highlights risk in advance rather than after the threshold is crossed.

Overtime is presented not just as hours, but as cost impact, allowing management to make informed decisions about reassignments, approvals, or schedule adjustments.

Block 7: Alerts, Exceptions, and Operational Intelligence

This block acts as the system's early warning layer.

Rather than requiring managers to manually monitor dashboards, the platform surfaces important exceptions automatically. These may include attendance anomalies, location violations, overtime risks, or unusual behaviour patterns.

Alerts are prioritised and contextual, helping supervisors focus on what actually requires attention rather than noise. Where applicable, confidence indicators help distinguish between high-risk and low-risk events.

The goal of this block is to reduce operational blind spots and enable timely intervention.

Block 8: Reporting and Oversight

This block provides visibility after execution.

The platform generates structured reports covering workforce activity, attendance, overtime, job execution, and compliance. Reports can be used for internal reviews, audits, payroll validation, and management analysis.

Because all data originates from the same system, reporting is consistent and reliable, eliminating reconciliation across multiple tools.

Block 9: Automation, Controls, and Future Integrations

This block ensures the platform remains flexible and future-ready.

Business rules such as alerts, notifications, and thresholds can be configured centrally. The system is designed with integration readiness in mind, allowing data to flow to payroll, accounting, or other operational systems when required.

This block ensures the platform can evolve alongside Zion's operations rather than becoming a fixed or limiting tool.

7. Core Focus Areas

Operational Clarity

The platform is designed to give operations and management teams a clear, real-time view of workforce activity, job execution, attendance, and overtime exposure. Information is surfaced contextually, reducing the need to navigate across disconnected sections.

Workflow-Driven User Experience

Rather than presenting generic screens, the system is built around how dispatch and field operations actually flow. From job assignment to execution and reporting, users move through logical, connected steps with minimal friction.

Clean and Intuitive Interface

Special attention is given to UI clarity, spacing, visual hierarchy, and consistency. The interface is designed to feel purpose-built rather than templated, reducing the learning curve and enabling faster adoption across teams.

Mobile-First Field Enablement

The employee mobile app is designed for simplicity and reliability in real-world field conditions. Core actions are streamlined so employees can focus on their work rather than the tool itself.

Scalability and Future Readiness

Phase 1 is architected so that additional modules, integrations, and intelligence layers can be added without reworking the foundation.

7. Commercial and Delivery Timelines

Component	Description	Price (USD)
Core Platform	Admin Web Dashboard, Employee Mobile App, core dispatch, workforce management, attendance tracking, location tracking, overtime monitoring, reporting foundation, UI/UX design	22,600
Advanced Overtime Logic	Configurable rules, alerts, cost impact visibility	
Geo-Fencing and Location Intelligence	Self - Editable Job site geofencing, violation detection, location-based alerts	
Automation and Alerts	Rule-based notifications and exception handling and Triggers for Admin with Advanced Analytics	
Integration Readiness Layer	API-ready structure and initial integration hooks	
Mileage Tracker	Mileage Tracker for Employee App to report trip Mileage	
Total		22,600

***Price is All Inclusive of All Components discussed and documented as of this proposal and Approved Delivery Plan.**

8. Delivery Timeline:

- **Phase 1 Duration:** 3 to 4 months
- **Initial Design and Alignment:** First 3 to 4 weeks
- **Core Development and Iterations:** Following 8 to 10 weeks
- **Stabilization and Launch Readiness:** Final 2 to 3 weeks

8. Payment Terms

S.No	Description	Percentage
1.	Project kickoff, architecture finalized, and delivery plan approved	20%
2.	UI/UX completed and integrated with backend flows	20%
3.	Core dispatch & workforce features delivered in staging and demonstrated	20%
4.	User Acceptance Testing (UAT) Sign - Off	20%
5.	Production Go-live with 30 days of stable operations	20%

***Updated Payment Structure as per Hunter and Aaditya (Nile Technologies).**

9. Warranty and Benefits Offered

- **Four (4) months of complimentary post-deployment support** shall be provided by Nile Tech.
- The quoted amount constitutes **all-inclusive pricing** for design, development, testing, deployment, and go-live activities.
- **In case of a Mobile App - Hosting setup, deployment, and submission to the Apple App Store and Google Play Store are included**; the client to create Apple and Google accounts to retain platform ownership.
- **Third Party Account** if any to be created by client.
- **All revisions, compliance changes, and mandatory modifications** requested by Apple or Google during the review and approval process **shall be implemented at no additional cost to client.**
- **No monthly or annual recurring charges** of any kind shall be payable to Nile Tech for the delivered platform.
- **All intellectual property, source code**, and associated rights shall **be fully transferred** to and **retained by the client upon completion.**
